

The most efficient COOLANT COALESCER for removing tramp oil from your sump.

Benefits

- The Brick is a 6-gallon unit.
- The Bucket is a 12-gallon unit.
- It can be used in sumps from 30 to 300 plus gallons capacity.
- No media to clean! This will help in saving valuable maintenance time and resources. Simply drain the oil off every 1-2 weeks and clean the unit with dish soap & hot water once every quarter.
- Other than the pump, no moving parts to wear out!
- Patented floating weir that fits into any tiny sump opening and creates cascading effect that only skims the very top of the coolant.
- Aerates coolant unlike a belt/disc skimmer killing an aerobic bacteria in the process.
- Utilizes a 400 gph pump that in conjunction with the discharge creates a robust coolant circulation that allows for the capture of tramp oil from all nooks and crannies of your sump!
- Unlike a typical belt/disc skimmer there is no wasted coolant to dispose of! Simply open the red valve and drain waste oil into a container until you see clean coolant.
- The unit is sealed with a lid and bulkhead fittings on all other openings, so no spills or messes!
- A patent pending central coalescing column that very effectively separates-emulsified oil from coolants as well as traps fines!

The coalescer's are designed to increase profits while reducing expenses by greatly extending the life of your coolant by eliminating the food source for bad bacteria and introduces oxygen that inhibits the growth of anaerobic bacteria. A bacteria free coolant environment will also eliminate bad smells and most importantly protect your most-valuable asset (your people) from contracting skin conditions and infections!

Both "The Bucket" & "The Brick" are **Veteran Owned** and **Made in America!**
